

My First 100 Days at Jupiter

What I want to understand before I start

1. Where do the transcripts and emails actually come from?
How accurate and efficient is the speech-to-text model? (Open AI Whisper, Elevenlabs Scribe)
 - If input data (transcripts) are messy, everything built on top of them is messy too.
2. I want to know what legal and data protection allows and limits.
The recorded conversations and emails - the input data:
 - how long can it be stored?
 - What can be stored?
 - Who can access it or see it?
 - where automated decisions are off limits? (Article 22 GDPR, Section 31 BDSG)
([The SCHUFA Holding Case C-634/21](#))
3. The current state of Jupiter.
 - What is a prototype?
 - What is already in production?
 - Who owns which part of Jupiter?
4. I want to understand the clear and defined objectives of Jupiter.
How do customer management and collections actually work?

Who I talk to first and why

1. Who knows Jupiter's pipelines best (Direct Team)
Why: I need the technical reality before anything else.
2. Important. Two or three experienced customer management agents.(coaches)
Why: - They have real conversations that Jupiter analyzes.
 - They know clearly which calls or emails go wrong and why .
 - They know a real-time hint would actually help or annoy them.
3. The department lead.
Why: I want to know in the two use cases, which one needs to be prioritized first.

My first concrete result at the end of week 1

A short document.

- My clear understanding of how data flows from call recording to usable output

- The Gaps i found
- Clear comparison of the data that we have and the data we don't have yet for the risk and coaching agent.
- My clarifying and open questions that need a decision from the team.

Week 2-6 and where I am at day 100

1. Week 2-3

- I go into the actual data. Sample of transcripts, customer emails, and all other input data
 - Check how reliable the current structure is in topics, payment signals, tones.
- Result: Simple data quality baseline metric (with help of Coaches)

2. Week 3-4

- Reverse Engineering: What does success actually look like for Jupiter?
 - ex: At least 60% of the coaching hints are useful for the Customer Management agents.
- Result: One-page document with clearly defined success for the Jupiter (also metrics- with help of Jupiter department)

3. Week 4-6

- Defining and designing the flow of the prototype
 - Build a small prototype and test it with a smaller amount of data.
- Result: Small prototype.

4. Week 7-14

- The Longest Stretch
- Run the small prototype with 2 or 3 feedback rounds with 2-3 experienced customer agents.
- Iterations, Precision of accuracy metrics, Collaboration with experienced customer agents and increasing its efficiency.

5. Day 100

- Three things on the table.
- A working prototype for one use case with results.
 - Written document with the recommendations on whether it is ready for small live pilot(MVP)
 - Written document of what is still missing, updates and everything for the second use case.

Bonus Question: Which use case and how?

I would start with a coaching agent.

- With coaching, a human is always in the loop. (Human Sense check)
- If the hint goes wrong, the agent ignores it and reports.
- By the report, we can test fast
learn fast
iterate fast.

Risk Agent:

- A wrong signal can change how we treat a customer who is already in financial trouble.
- Needs : Slower and More Validation.
More Compliance Work.

In the two agents, the validation layers and human check is mandatory unless it reaches the highest accuracy metric that we defined.

Best Strategic Hints- Right Timing of contact (Early signals) - successful customer management

How would I approach:

1. Deciding the quality of the input data
Sitting with 2 or 3 experienced coaches on real call examples:
 - what good moments look like
 - what weak moments in a conversation look like
2. Building small labeled test set samples
3. Build a Minimum Viable Product(prototype) that gives simple and explainable hints.
4. Test with small groups of agents and test samples collect their feedback weekly

Define(decide every element) - Build Mvp - Test - collect Feedbacks -Iterate(until highest accuracy) - live pilot

- 1) Best Strategic Hints
- 2) Early Signals Detection - Risk Mitigation
