

Your first 100 days at Jupiter

Imagine you start today as a working student at auxmoney — right inside Project Jupiter.

Jupiter is a platform that uses AI to analyse, structure and make usable several tens of thousands of customer contacts per month for Customer Service and Debt/Receivables Management. The basis for this consists of recordings of conducted conversations, from which we automatically generate transcripts, as well as customer emails — these form the data basis for Jupiter.

With the data obtained, we want to put concrete AI agents into operation: for example a Risk Agent that detects early signals of impending payment defaults and counteracts them, or a Coaching Agent that actively accompanies our human agents in real time and specifically improves their conversation quality.

Your task

Describe your first 100 days at Jupiter.

What do you want to understand before you start?

Who do you talk to first — and why?

What is your first concrete result at the end of the first week?

What do weeks 2–6 look like, and what have you achieved by day 100?

Bonus question: Which single use case would you prioritise in the first 100 days — and how would you approach it?

Validation layer and human sense

Psychology of the user in financial situations(bulk data)

Coaches

One weekend in 2006, two university friends, Raffael and Philip

Why do people actually need banks to borrow money?

auxiliari = to help and money = money. Therefore: **to support with money.**

Coaching improves the quality of the contact.

Risk Agent improves the timing of the contact.

Instant Operational Efficiency (Instant hints for agents to solve for the left lean)

Proactive Risk Mitigation (We can avoid risk proactively.)

Smart Resource Prioritization

wherever you want?"

Questions they'll likely ask about the task

- Walk us through your plan.
- **Why the Coaching Agent and not the Risk Agent?** — then the pushback: *"But the Risk Agent saves us money directly. Why not that?"* Have your answer ready and don't fold.
- Why 60%? How would you actually measure "useful"?
- **What if the agents don't want to be coached?** — this is Hannah's question, almost certain.
- What could go wrong with your plan?
- What if we told you to do the Risk Agent instead?
- You mention Article 22 GDPR — what does that mean for us in practice?
- What exactly would you ask the agents in week 1?
- What does "working prototype" actually mean at day 100?
- How is this different from what our team leads already do when they listen to calls?
- What if the data isn't accessible in week 1?

Questions about you

Near-certain: **how much German do you have?** · how many hours and which days · when can you start · exam periods · why auxmoney · **tell us about the LLM tool at MicroIntech — what did it actually do?** (the 40% figure will be probed; be ready with the concrete before-and-after).

Likely: why Customer Management rather than a pure tech role · how do you balance a Master's with work · you worked remote for a US company, how did that go · a time when data quality was bad and what you did.

One inconsistency to prepare for: your CV header says 40213 Düsseldorf, your cover letter says Essen. Both August 2026. If they notice, have a clean one-line answer about where you actually live and how you'd get to Kasernenstr.

Section 31 BDSG

exception to the strict limits of Article 22

the assumption that credit scoring was exempt from Article 22's heavy restrictions, creating a massive gap in consumer protection.

Case Law on Article 22

1. The SCHUFA Holding Case (Case C-634/21)

- **Official Link:** [CJEU Case C-634/21 - Curia](#)
- **The Problem:** SCHUFA, Germany's dominant credit rating agency, uses proprietary algorithms to generate credit scores. It argued that it only provides "preparatory support" and that third parties (like banks) make the actual decision. However, banks almost always reflexively reject applicants with bad SCHUFA scores, resulting in an automated "rubber stamp" pipeline.
- **The Ruling:** The [European Court of Justice \(CJEU\)](#) ruled that generating an automated score constitutes an "automated decision" under Article 22 if a third party "draws strongly" or relies heavily on that score to establish or terminate a contract.
